Data Types \ String \ Variable

Set

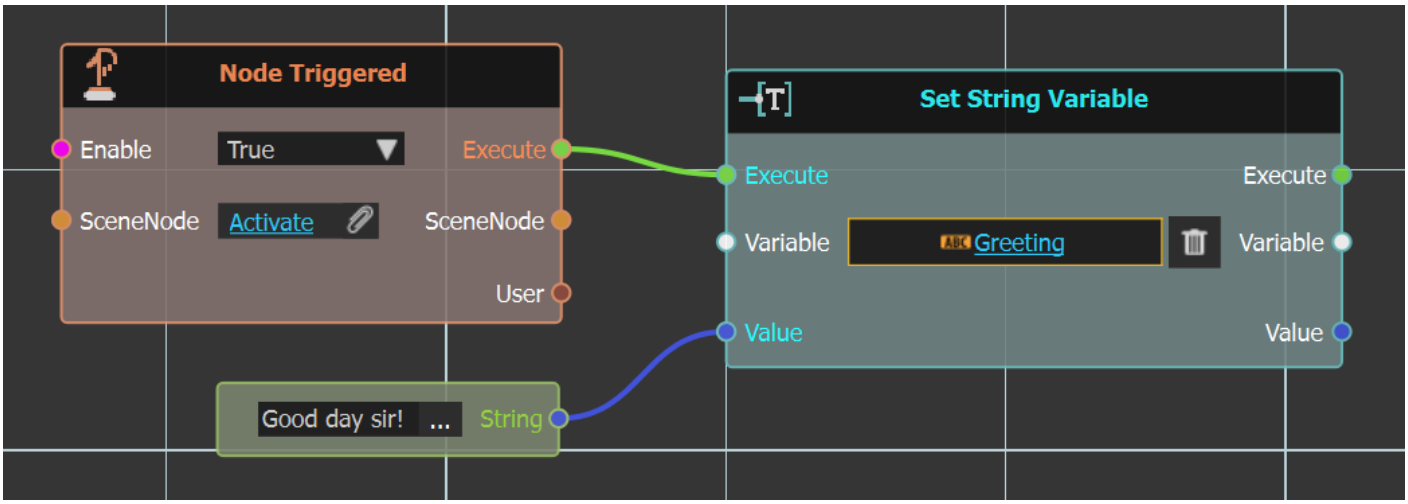

With this string variable node a user can set a string variable by Value or Expression.

Set String Variable

Using this node a string variable is set by value, as shown in the example below. The **Greeting** variable is set using string input node with "**Good day sir!**"

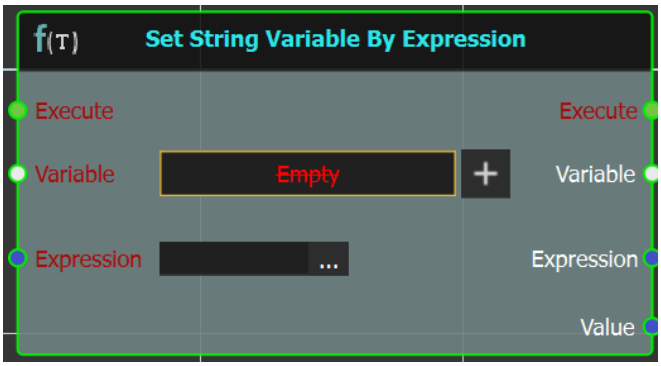

Example

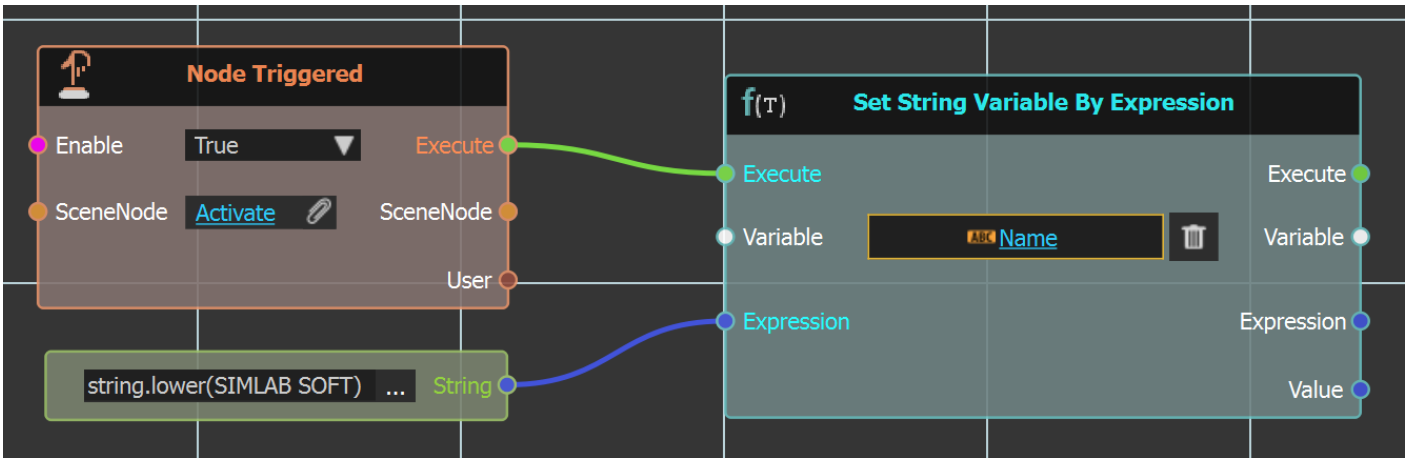

Set String Variable By Expression

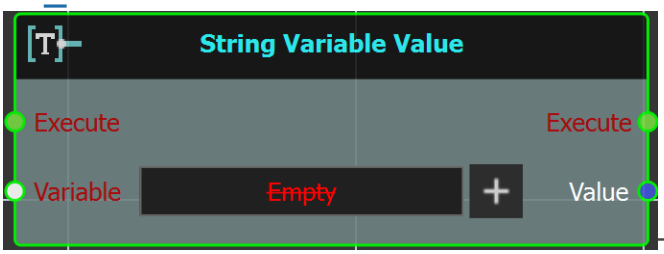

Using this node a string variable is set by expression, as shown in the example below. The **Name** variable is set using an expression input node with string.lower() expression.

Example

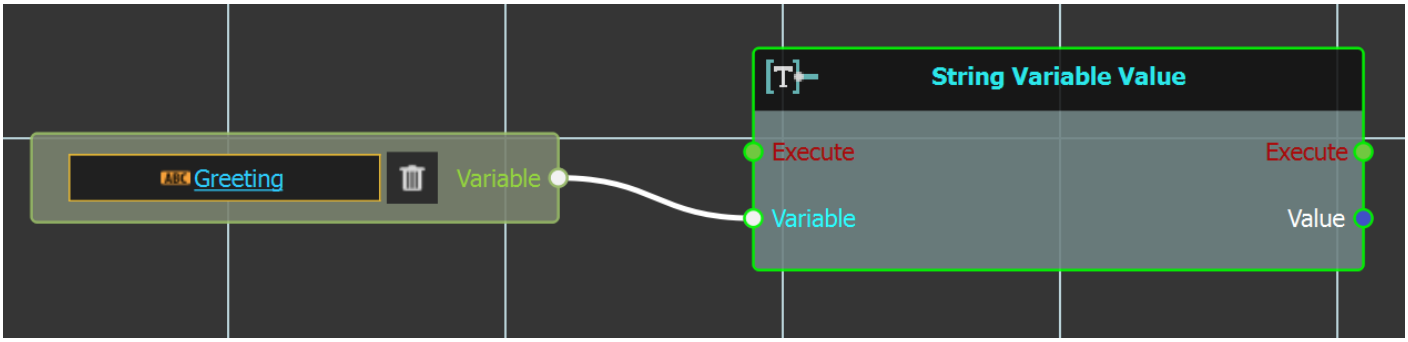

Get

This node is used to get a string variable value. As shown in the example below, the string variable **Greeting** is gotten as input to this node.
